Harald Welte <laforge@netfilter.org>

Introduction
Highly Scalable Linux Network Stack
Netfilter Hooks
Packet selection based on IP Tables
The Connection Tracking Subsystem
The NAT Subsystem
IPsec with Free S/WAN
IPsec with Kernel 2.6.x
Cipe, vtun, openvpn and others
Traffic Shaping, QoS, Policy Routing

Firewalls, IPsec and Linux Introduction

What this is:
 A broad overview about the advanced Linux networking features
 Intended for a network savyy audience that has little Linux background

What this presentation is not:

- □A tutorial on how to use iptables, tc, iproute2, brctl
- □An introduction into the cool code we write every day ;)

It will try to show you what you can do with Linux networking, not how.

Linux and Networking

□Linux is a true child of the Internet

□ Early adopters: ISP's, Universities

□Lots of work went into a highly scalable network stack

□Not only for client/server, but also for routers

□Features unheared of in other OS's

Firewalls, IPsec and Linux Introduction

Did you know, that a stock 2.6.5 linux kernel can provide

a stateful packet filter ?
fully symmetric NA(P)T ?
policy routing ?
QoS / traffic shaping ?
IPv6 firewalling ?
packet filtering, NA(P)T on a bridge ?
layer 2 (mac) address translation ?

If not, chances are high that this presentation will tell you something new.

Firewalls, IPsec and Linux Netfilter Hooks

□What is netfilter?

OSystem of callback functions within network stack

 Callback function to be called for every packet traversing certain point (hook) within network stack

OProtocol independent framework

OHooks in layer 3 stacks (IPv4, IPv6, DECnet, ARP)

OMultiple kernel modules can register with each of the hooks

Traditional packet filtering, NAT, ... is implemented on top of this framework

Can be used for other stuff interfacing with the core network stack, like DECnet routing daemon.

 \Box Packet selection using IP tables

OThe kernel provides generic IP tables support

OEach kernel module may create it's own IP table

 The three major parts of 2.4 firewalling subsystem are implemented using IP tables

▷ Packet filtering table 'filter'

▷NAT table 'nat'

▷ Packet mangling table 'mangle'

○Could potentially be used for other stuff, e.g. IPsec SPDB

□ Managing chains and tables

An IP table consists out of multiple chains
A chain consists out of a list of rules
Every single rule in a chain consists out of
▷match[es] (rule executed if all matches true)
▷target (what to do if the rule is matched)

matches and targets can either be builtin or implemented as kernel modules

• The userspace tool iptables is used to control IP tables

handles all different kinds of IP tables
 supports a plugin/shlib interface for target/match specific options

Firewalls, IPsec and Linux Connection Tracking Subsystem

□Connection tracking...

oimplemented seperately from NAT

oenables stateful filtering

oprotocol modules (currently TCP/UDP/ICMP/GRE/SCTP)

oapplication helpers (currently FTP,IRC,H.323,talk,SNMP,RTSP)

odoes _NOT_ filter packets itself

ocan be utilized by iptables using the 'state' match

 $\circ is$ used by NAT Subsystem

Firewalls, IPsec and Linux Network Address Translation

□Network Address Translation

 Previous Linux Kernels only implemented one special case of NAT: Masquerading

○Linux 2.4.x / 2.6.x can do any kind of NAT.

ONAT subsystem implemented on top of netfilter, iptables and conntrack

○Following targets available within 'nat' Table

▷ SNAT changes the packet's source whille passing NF_IP_POST_ROUTING

▷DNAT changes the packet's destination while passing NF_IP_PRE_ROUTING

▷ MASQUERADE is a special case of SNAT

▷ REDIRECT is a special case of DNAT

Firewalls, IPsec and Linux Packet Mangling

Purpose of mangle table
packet manipulation except address manipulation
Targets specific to the 'mangle' table:
DSCP - manipulate DSCP field
IPV4OPTSSTRIP - strip IPv4 options
MARK - change the nfmark field of the skb
TCPMSS - set TCP MSS option
TOS - manipulate the TOS bits
TTL - set / increase / decrease TTL field

Firewalls, IPsec and Linux Linux Bridging

□Bridging (brctl)

- ○Includes support for Spanning Tree
- ○Fully supports packet filtering and NAT (!) on a bridge
- ○Can also filter and translate layer 2 MAC addresses
- •Can implement a 'brouter' (bridge certain traffic, route other)

Firewalls, IPsec and Linux Policy Routing

- □ Policy Routing (iproute2)
 - OAllows routing decisions on arbitrary information
 - $\odot \mbox{Provides}$ up to 255 different routing tables within one system
 - By combining via nfmark with iptables, any matches of the packet filter can be used for the routing decision
 - Very useful in complex setups with mutiple links (e.g. multiple DSL uplinks with dynamic addresses, asymmetric routing, ...)

Firewalls, IPsec and Linux Linux Traffic Shaping

□Traffic Control (tc)

○ Framework for lots of algorithms like RED, SFQ, TBF, CBQ, CSZ, GRED, HTB

- $\odot Very$ granular control, especially for very low bandwidth links
- ○Present since Linux 2.2.x but still not used widely
- OLack of documentation, but situation is improving (www.lartc.org)

Firewalls, IPsec and Linux Free S/WAN

□Free S/WAN

○Was a politically motivated effort to provide IPsec for Linux 2.0+

- ○Goal was to encrypt as much Internet Traffic as possible
- OSoftware architecture didn't fit very well with Linux 2.4/2.6 network stack

OProject has been shut down, however Open S/WAN continues support

○Is in widespread production use and has received a lot of testing

Political motivation prevented any U.S. citizen to contribute code

Firewalls, IPsec and Linux Linux 2.6.x IPsec

□Linux 2.6.x IPsec

 Linux networking gods disaproved Free S/WAN political restrictions and software design

○Thus, they decided to write their own IPsec stack

OResult is in the stock 2.6.x kernel series

Offers complete support for transport and tunnel mode

 $\circ \text{Can}$ be used with FreeSWAN (pluto) or KAME (isakmpd) userspace

○Remaining problems

 ${}^{\vartriangleright}$ No integration with hardware crypto accelerators yet

- ▷No implementation of NAT traversal yet
- ▷ Interaction with iptable_nat still has to be sorted out

Firewalls, IPsec and Linux cipe, vtun, openswan and others

□Other VPN protocols/programs

 Evolved as linux specific VPN implementations since the Linux Kernel was lacking stock IPsec support for a long time

- OAre totally incompatible to IPsec and only compatible to themselves
- OAre of questionable security (at least in case of cipe, vtun)
- Are mostly userspace implementations
- OAre way easier to configure
- •Can provide layer 2 tunnels to route (or bridge!) all kinds of protocols
- openvpn with X.509 certificates is a very clean and easy solution for building strong VPN tunnels between two linux gateways

□Thanks to ○the BBS scene, Z-Netz, FIDO, ...

▷ for heavily increasing my computer usage in 1992

OKNF (http://www.franken.de/)

▷ for bringing me in touch with the internet as early as 1994

▷ for providing a playground for technical people

▷ for telling me about the existance of Linux!

OAlan Cox, Alexey Kuznetsov, David Miller, Andi Kleen

▷ for implementing (one of?) the world's best TCP/IP stacks

OPaul 'Rusty' Russell

▷ for starting the netfilter/iptables project

▷ for trusting me to maintain it today

○Astaro AG

▷ for sponsoring parts of my netfilter work

□The slides and the an according paper of this presentation are available at http://www.gnumonks.org/
